

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions and listings of claims in the application:

1. - 4. canceled

B 1  
5. (currently amended) An organic light-emitting device comprising a light-emissive organic layer interposed between first and second electrodes for injecting charge carriers into the light-emissive organic layer, at least one of said first and second electrodes comprising a plurality of layers including a first electrode layer having a high resistance adjacent the surface of the light-emissive organic layer remote from the other of the first and second electrodes, said first electrode layer comprising a high-resistance material selected from the group consisting of a mixture of a semiconductor material with an insulator material, a mixture of a semiconductor material with a conductor material and a mixture of an insulator material with a conductor material, and the first electrode layer having a thickness of at least 0.5 microns.

6. (currently amended) An organic light-emitting device according to claim [1] 5 wherein the first electrode layer comprises at least one material having a low work function.

7. (currently amended) An organic light-emitting device according to claim [1] 5 wherein the semiconductor material is selected from the group consisting of Ge, Si,  $\alpha$ -Sn, Se, ZnSe, ZnS, GaAs, GaP, CdS, CdSe, MnS, MnSe, PbS, ZnO, SnO, TiO<sub>2</sub>,

MnO<sub>2</sub>, and SiC, or wherein the insulator material is selected from the group consisting of an oxide, a nitride and a fluoride, ~~preferably from the group consisting of Al<sub>2</sub>O<sub>3</sub>, SiO<sub>2</sub>, LiO, AlN, SiN, LiF and CsF.~~

8. (currently amended) An organic light-emitting device according to claim [1] 5 wherein the conductor material is a ductile metal ~~and preferably is selected from the group consisting of Al and Ag.~~
9. (currently amended) An organic light-emitting device according to claim [1] 5 wherein the first electrode layer is comprised of a mixture selected from the group consisting of LiF/Al, Ca/Ge, Li/Si, Ca/ZnO, LiF/ZnSe and CsF/ZnS.
10. (currently amended) An organic light-emitting device comprising a light-emissive organic layer interposed between first and second electrodes for injecting charge carriers into the light-emissive organic layer, ~~and means for electrically isolating any conducting defect in the organic layer from an associated electrode~~ wherein at least one of said first and second electrodes comprises a plurality of layers including a thin first electrode layer adjacent the surface of the light-emissive organic layer remote from the other of the first and second electrodes, the dimensions and material properties of said thin first electrode layer being such that, adjacent a conducting defect in said organic layer, said first electrode layer will vaporize when subject to an anomalous current resulting from said conducting defect so as to

electrically isolate said conducting defect from an associated electrode.

11. - 13. canceled

14. (currently amended) An organic light-emitting device according to claim [12] 10, further comprising a ~~light-emissive organic layer interposed between first and second electrodes for injecting charge carriers into the light-emissive organic layer at least one of said first and second electrodes comprising a plurality of layers including a thin first electrode layer comprising a high work function material adjacent the surface of the light-emissive organic layer remote from the other of the first and second electrodes, and a second electrode layer adjacent the surface of the first electrode layer remote from the organic light-emissive material, said second electrode layer comprising a layer of a high-resistance material selected from the group consisting of a semiconductor material, a mixture of a semiconductor material with an insulator material, a mixture of a semiconductor material with a conductor material and a mixture of an insulator material with a conductor material.~~

15. (currently amended) An organic light-emitting device comprising a light-emissive organic layer interposed between first and second electrodes for injecting charge carriers into the light-emissive organic layer, at least one of said first and second electrodes ~~being opaque and~~ comprising a plurality of layers including a thin first electrode layer comprising a low work function material adjacent the surface of the light-emissive organic layer remote from the other of the first and second

electrodes, and a second electrode layer adjacent the surface of the first electrode layer remote from the light-emissive organic layer, said second electrode layer comprising a layer of a high-resistance material selected from the group consisting of a semiconductor material, a mixture of a semiconductor material with an insulator material, a mixture of a semiconductor material with a conductor material and a mixture of an insulator material and a conductor material, and the first electrode layer having a thickness of at least 0.5 microns.

16. - 21. canceled

22. previously canceled

23. (original) A light-emissive device comprising a layer of light-emissive material arranged between first and second electrode layers such that charge carriers can move between the first and second electrode layers and the light-emissive material, wherein at least the first electrode layer comprises a plurality of sub-electrodes, each sub-electrode being connected to each of any sub-electrodes directly surrounding it via a fusible link, each fusible link adapted to break when subject to a current exceeding a specified value to electrically isolate the respective sub-electrode from the other sub-electrodes.

24. (currently amended) A light-emissive device according to claim [11] 10 and wherein said at least one of said first and second electrodes comprises a plurality of sub-electrodes, each sub-electrode being connected to each of any sub-electrodes directly surrounding it via a fusible link, each fusible link adapted to break when subject to a current exceeding a specified value to electrically isolate the respective sub-electrode from the other sub-electrodes.

25. (previously amended) A light-emissive device according to claim 23 wherein the plurality of sub-electrodes are arranged to create an ordered array of parallel rows and columns, and each of the sub-electrodes is connected via a fusible link to each of any sub-electrodes directly adjacent to it in the same column and row.

26. (previously amended) A light-emissive device according to claim 23 wherein the size and spacing of the sub-electrodes is selected such that, during operation of the device, the light emitted by the light-emissive device appears to the human eye to be continuous in intensity across the whole area of light emission.

27. - 55. canceled

56. (currently amended) An organic light-emitting device according to claim [13] 15 wherein the first electrode layer is comprised of a layer of a material selected from the group consisting of Ca, Li, Yb, LiF, CsF and LiO.

57. (currently amended) An organic light-emitting device according to claim [13] 15 wherein the thickness of the first electrode layer is in the range of 0.5nm to 10nm, ~~preferably less than 5nm.~~

58. canceled

59. previously canceled

60. (new) An organic light-emitting device according to claim 5 wherein said first electrode layer has a resistivity in the range  $10^2$  Ohm.cm to  $10^5$  Ohm.cm.

61. (new) An organic light-emitting device comprising a light-emissive organic layer interposed between first and second electrodes for injecting charge carriers into the light-emissive organic layer, at least one of said first and second electrodes comprising a plurality of layers including a first electrode layer having a high resistance adjacent the surface of the light-emissive organic layer remote from the other of the first and second electrodes, said first electrode layer comprising a high-resistance material wherein the first electrode layer is comprised of a mixture selected from the group consisting of LiF/Al, Ca/Ge, Li/Si, Ca/ZnO, LiF/ZnSe and CsF/ZnS.

62. (new) An organic light-emitting device according to claim 15 wherein said second electrode layer has a resistivity in the range  $10^2$  Ohm.cm to  $10^5$  Ohm.cm.

63. (new) A light-emissive device according to claim 24 wherein the plurality of sub-electrodes are arranged to create an ordered array of parallel rows and columns, and each of the sub-electrodes is connected via a fusible link to each of any sub-electrodes directly adjacent to it in the same column and row.

64. (new) A light-emissive device according to claim 24 wherein the size and spacing of the sub-electrodes is selected such that, during operation of the device, the light emitted by the light-emissive device appears to the human eye to be continuous in intensity across the whole area of light emission.

65. (new) An organic light-emitting device comprising a light-emissive organic layer interposed between first and second electrodes for injecting charge carriers into the light-emissive organic layer, at least one of said first and second electrodes comprising a plurality of layers including a first electrode layer having a high resistance adjacent the surface of the light-emissive organic layer remote from the other of the first and second electrodes, said first electrode layer comprising a high-resistance material selected from the group consisting of a mixture of a semiconductor material with an insulator material, a mixture of a semiconductor material with a conductor material and a mixture of an insulator material with a

conductor material, wherein said first electrode layer has a product of resistivity and thickness of at least 0.005 Ohm.cm<sup>2</sup>.

66. (new) An organic light-emitting device comprising a light-emissive organic layer interposed between first and second electrodes for injecting charge carriers into the light-emissive organic layer, at least one of said first and second electrodes comprising a plurality of layers including a thin first electrode layer comprising a low work function material adjacent the surface of the light-emissive organic layer remote from the other of the first and second electrodes, and a second electrode layer adjacent the surface of the first electrode layer remote from the light-emissive organic layer, said second electrode layer comprising a layer of a high-resistance material selected from the group consisting of a semiconductor material, a mixture of a semiconductor material with an insulator material, a mixture of a semiconductor material with a conductor material and a mixture of an insulator material and a conductor material, wherein said second electrode layer has a product of resistivity and thickness of at least 0.005 Ohm.cm<sup>2</sup>.

67. (new) An organic light-emitting device according to claim 7, wherein the insulator material is selected from the group consisting of Al<sub>2</sub>O<sub>3</sub>, SiO<sub>2</sub>, LiO, SiN, LiF, and CsF.
